WHY MEASURE CHICK YIELD?

• Chick yield (the weight of the chick at hatch as a percentage of egg setting weight) is a simple method of checking whether hatch timing and incubation parameters are correct.

• Chicks with a low yield have either been:
  1. hatched for a long time before they were removed from the hatcher or,
  2. incubated at a high temperature or a low humidity.

These chicks are at risk of being dehydrated and perform poorly on the farm.

• Chicks with a high yield have either:
  1. only just finished hatching when they were removed from the hatcher or,
  2. have been incubated at a low temperature or a high humidity.

If placed on the farm quickly these chicks will not be ready to eat and drink and will tend to be lazy.

OPTIMUM CHICK YIELD

> 68%
High
This chick will be lazy and not ready to feed and drink when placed on farm.

67 - 68%
Ideal
This chick will be active and ready to feed and drink when placed on farm.

< 67%
Low
This chick will be dehydrated and have little yolk reserve. Often very active and noisy.

Note: If chicks are to be placed onto the farm the day after hatch 1% should be added to the above ranges, i.e. optimum chick yield would be 68-69%.
If eggs are stored 0.5% should be added for each week of storage i.e. for eggs stored for 2 weeks optimum chick yield would be 68-69%.
THE PROCEDURE FOR MEASURING CHICK YIELD

- To accurately measure chick yield and check the hatch timing of a flock:
  - monitor the chick yield from 3 incubator trays
  - use a balance that can weigh a whole incubator tray of eggs or a box of chicks to an accuracy of at least 5 grams (0.2 oz)

Note: This procedure can be easily combined with the monitoring of egg water loss.

**Step 1:**
Weigh empty setter tray – record weight.

*Note: This can be done at setting or transfer.*

**Step 2:**
Fill setter tray with fresh eggs. Exclude any cracked or poor shell quality eggs.

**Step 3:**
Weigh full setter tray – record weight and number of eggs on tray.

**Step 4:**
Label the tray so that it can be relocated at transfer.

*Note: Trays should be located in the incubator so that one is positioned near the top, one near the middle and one near the bottom of the incubator rack.*

**Step 5:**
At transfer ensure the hatcher tray is labelled so that it can be associated with the correct egg tray.

**Step 6:**
At hatch take-off, zero the balance with the empty chick box.

*Note: If the chicks are to be vent sexed then the chicks need to be weighed before sexing.*

**Step 7:**
Count all the good chicks from the hatcher basket into the box - record number.

**Step 8:**
Weigh the full chick box – record weight.
CALCULATION OF CHICK YIELD

% Chick Yield = \frac{\text{Average Chick Weight}}{\text{Average Fresh Egg Weight}} \times 100

Empty tray = 1205g;
Full tray @ set = 8201g; Number of eggs = 132;
Full chick box @ hatch = 4268g; Number of chicks = 120

% Chick Yield = \frac{4268 - 120}{(8201 - 1205) \div 132} \times 100

This calculation also applies to imperial measurements

Example of chick yield recording sheet. This sheet also records egg water loss information as the two quality control processes can be easily combined - see How To... Measure Egg Water Loss.

Egg Weights and Chick Weights

Company: ACME Farming  Date Set: 26th Oct 2009
Farm: Windyhill Farm  Date Hatched: 16th Nov 2009
Age: 26 weeks  Date Broken Out: 16th Nov 2009
Setter No.: 1, 2 and 3  Hatcher No.: 1

INTERPRETING RESULTS

The graph below shows the chick yield results from 3 different flocks:

- **Flock 1** has chick yields within the acceptable range. No action required.
- **Flock 2** has slightly high chick yield but close to the acceptable range. Action: Check the chick yield from this flock again and if it is still high, use table below to investigate the cause of the high chick yield.
  
  Note: This high chick yield would be acceptable if the chicks do not arrive on the farm on the same day as hatch.
- **Flock 3** has low chick yield and these chicks will be at risk of dehydration. Action: Use the table below to determine the cause of the low chick yield.

 FACTORS AFFECTING CHICK YIELD
